# The Smallest Degree Sum that Yields Potentially $C_{k}$-graphical Sequences 

Chunhui Lai *<br>Department of Mathematics, Zhangzhou Teachers College, Zhangzhou, Fujian 363000, P. R. of CHINA<br>zjlaichu@public.zzptt.fj.cn<br>Journal of Combinatorial Mathematics and Combinatorial Computing 49 (2004), 57-64.

#### Abstract

In this paper we consider a variation of the classical Turán-type extremal problems. Let $S$ be an $n$-term graphical sequence, and $\sigma(S)$ be the sum of the terms in $S$. Let $H$ be a graph. The problem is to determine the smallest even $l$ such that any $n$-term graphical sequence $S$ having $\sigma(S) \geq l$ has a realization containing $H$ as a subgraph. Denote this value $l$ by $\sigma(H, n)$. We show $\sigma\left(C_{2 m+1}, n\right)=$ $m(2 n-m-1)+2$, for $m \geq 3, n \geq 3 m ; \sigma\left(C_{2 m+2}, n\right)=m(2 n-m-$ $1)+4$, for $m \geq 3, n \geq 5 m-2$.

Key words: graph; degree sequence; potentially $H$-graphic sequence
AMS Subject Classifications: 05C07, 05C35

## 1 Introduction

If $S=\left(d_{1}, d_{2}, \ldots, d_{n}\right)$ is a sequence of non-negative integers, then it is called graphical if there is a simple graph $G$ of order $n$, whose degree sequence

[^0]$\left(d\left(v_{1}\right), d\left(v_{2}\right), \ldots, d\left(v_{n}\right)\right)$ is precisely $S$. If $G$ is such a graph then $G$ is said to realize $S$ or be a realization of $S$. A graphical sequence $S$ is potentially $H$ graphical if there is a realization of $S$ containing $H$ as a subgraph, while $S$ is forcibly $H$ graphical if every realization of $S$ contains $H$ as a subgraph. Let $\sigma(S)=d\left(v_{1}\right)+d\left(v_{2}\right)+\ldots+d\left(v_{n}\right)$, and $[x]$ denote the largest integer less than or equal to $x$. If $G$ and $G_{1}$ are graphs, then $G \cup G_{1}$ is the disjoint union of $G$ and $G_{1}$. If $G=G_{1}$, we abbreviate $G \cup G_{1}$ as $2 G$. Let $K_{k}$, and $C_{k}$ denote a complete graph on $k$ vertices, and a cycle on $k$ vertices, respectively.

Given a graph $H$, what is the maximum number of edges of a graph with $n$ vertices not containing $H$ as a subgraph? This number is denoted $e x(n, H)$, and is known as the Turán number. This problem was proposed for $H=C_{4}$ by Erdös [2] in 1938 and in general by Turán [11]. In terms of graphic sequences, the number $2 e x(n, H)+2$ is the minimum even integer $l$ such that every $n$-term graphical sequence $S$ with $\sigma(S) \geq l$ is forcibly $H$ graphical. Here we consider the following variant: determine the minimum even integer $l$ such that every $n$-term graphical sequence $S$ with $\sigma(S) \geq l$ is potentially $H$ graphical. We denote this minimum $l$ by $\sigma(H, n)$. Erdös, Jacobson and Lehel [3] showed that $\sigma\left(K_{k}, n\right) \geq(k-2)(2 n-k+1)+2$ and conjectured that equality holds. They proved that if $S$ does not contain zero terms, this conjecture is true for $k=3, n \geq 6$. The conjecture is confirmed in [4],[7],[8], [9] and [10].

Gould, Jacobson and Lehel [4] also proved that $\sigma\left(p K_{2}, n\right)=(p-1)(2 n-$ $2)+2$ for $p \geq 2 ; \sigma\left(C_{4}, n\right)=2\left[\frac{3 n-1}{2}\right]$ for $n \geq 4$. Lai [5, 6] proved that $\sigma\left(C_{5}, n\right)=4 n-4$ for $n \geq 5$, and $\sigma\left(C_{6}, n\right)=4 n-2$ for $n \geq 7, \sigma\left(C_{2 m+1}, n\right) \geq$ $m(2 n-m-1)+2$, for $n \geq 2 m+1, m \geq 2, \sigma\left(C_{2 m+2}, n\right) \geq m(2 n-m-1)+4$, for $n \geq 2 m+2, m \geq 2, \sigma\left(K_{4}-e, n\right)=2\left[\frac{3 n-1}{2}\right]$ for $n \geq 7$. In this paper we prove that $\sigma\left(C_{2 m+1}, n\right)=m(2 n-m-1)+2$, for $n \geq 3 m$, $m \geq 3$; $\sigma\left(C_{2 m+2}, n\right)=m(2 n-m-1)+4$ for $n \geq 5 m-2, m \geq 3$.

## 2 Main results.

Theorem 1. Let $k \geq 4$. Let $S$ be a potentially $C_{k}$-graphical n-term sequence. If there exists $x \notin C_{k}, w \in C_{k}$ such that $d(x) \geq\left[\frac{k}{2}\right]+1, d(w) \geq 3$. Then $S$ has a realization containing a $C_{k+1}$.

Assume $C_{k}$ is $w_{1} w_{2} \cdots w_{k} w_{1}$. Let $w_{k+i}=w_{i}$. We first give the following three results.

Lemma (a) For any $x \notin C_{k}$, if there is $w_{r}, w_{r+1}$ such that $w_{r} x, w_{r+1} x \in$
$E(G)$, then $G$ contains a $C_{k+1}: w_{1} w_{2} \cdots w_{r} x w_{r+1} \cdots w_{k} w_{1}$.
Lemma(b) For any $x, y \notin C_{k}, x y \in E(G)$, if there is $w_{r}$ such that $w_{r} x \in$ $E(G), w_{r} y \notin E(G)$, then $S$ has a realization containing a $C_{k+1}$. (We see the edge $w_{r+1} x$ is not in $G$ or a $C_{k+1}$ would exist, but then the edge interchange which removes the edges $w_{r} w_{r+1}$ and $x y$ and inserts the edges $w_{r+1} x$ and $w_{r} y$ produces a realization containing a $\left.C_{k+1}: w_{1} w_{2} \cdots w_{r} x w_{r+1} \cdots w_{k} w_{1}\right)$

Lemma(c) For any $x, y \notin C_{k}, x y \in E(G)$, if there is $w_{r}, w_{r+2}$ such that $w_{r} x, w_{r+2} x \in E(G)$, then $S$ has a realization containing a $C_{k+1}$. (If $w_{r+2} y \notin E(G)$, then by Lemma(b), $S$ has a realization containing a $C_{k+1}$. Otherwise, $w_{r+2} y \in E(G)$ and so $G$ contains a $C_{k+1}: w_{1} w_{2} \cdots w_{r} x y$ $\left.w_{r+2} w_{r+3} \cdots w_{k} w_{1}\right)$

Proof of theorem 1. Assume every realization of $S$ does not contain a $C_{k+1}$. By Lemma(a), $x$ is adjacent to at most $\left[\frac{k}{2}\right]$ vertices of $C_{k}$. Since $d(x) \geq\left[\frac{k}{2}\right]+1$ there exists $x_{1} \notin C_{k}$ such that $x x_{1} \in E(G)$. Thus, by Lemma(c), $x$ is adjacent to at most $\left[\frac{k}{3}\right]$ vertices of $C_{k}$. Note that $\left[\frac{k}{3}\right] \leq\left[\frac{k}{2}\right]-1$ since $k \geq 4$. Hence there is $x_{2} \notin C_{k}, x_{2} \neq x_{1}$, such that $x x_{2} \in E(G)$.

Case 1. Suppose that there is $w_{i} \in C_{k}$ such that $w_{i} x \in E(G)$. By Lemma(b), $w_{i} x_{1}, w_{i} x_{2} \in E(G)$. By Lemma(a), $w_{i+1} x, w_{i+1} x_{1}, w_{i+1} x_{2} \notin$ $E(G)$. By Lemma(c) $w_{i+2} x, w_{i+2} x_{1}, w_{i+2} x_{2} \notin E(G)$. Then the edge interchange which removes the edges $w_{i+1} w_{i+2}$ and $x x_{2}$ and inserts the edges $w_{i+2} x$ and $w_{i+1} x_{2}$ produces a realization containing a $C_{k+1}$ : $w_{1} w_{2}$ $\cdots w_{i} x_{1} x w_{i+2} w_{i+3} \cdots w_{k} w_{1}$. This is a contradiction.

Case 2. Suppose for any $w_{i} \in C_{k}, w_{i} x \notin E(G)$. Since $d(x) \geq\left[\frac{k}{2}\right]+$ $1 \geq 2+1=3$, hence there is $x_{3} \notin C_{k}, x_{3} \neq x_{1}, x_{3} \neq x_{2}$ such that $x x_{3} \in E(G)$. By Lemma(b), $w_{i} x_{1}, w_{i} x_{2}, w_{i} x_{3} \notin E(G)$. Since there is $w \in C_{k}$ such that $d(w) \geq 3$, then there is $x_{4}$ such that $w x_{4} \notin E\left(C_{k}\right)$, $w x_{4} \in E(G)$. By Lemma(b), $x_{4}$ is not one of $x_{1}, x_{2}, x_{3}$. If $x_{3} x_{4} \in E(G)$, then by Lemma(b) $w x_{3} \in E(G)$ and thus, by Lemma(b) as well, so is $w x \in E(G)$. This is a contradiction. Thus $x_{3} x_{4} \notin E(G)$. Then the edge interchange which removes the edges $w x_{4}$ and $x x_{3}$ and inserts the edges $w x$ and $x_{3} x_{4}$ produces a realization containing the edge $w x$. By Case $1, S$ has a realization containing a $C_{k+1}$. This is a contradiction.

Theorem 2. Let $m \geq 3$. Let $S$ be an n-term graphical sequence. Suppose $S$ satisfies the following two conditions: (i) there is a realization $G$ of $S$ containing a $C_{2 m+1}$, such that for all $x, y \notin C_{2 m+1}, d(x)=d(y)=m$ and $x y \notin E(G)$, (ii) there is no realization of $S$ containing a $C_{2 m+2}$. Then $\sigma(S) \leq m(2 n-m-1)+2$.

Proof. Let $C_{2 m+1}$ be $w_{1} w_{2} \cdots w_{2 m+1} w_{1}$, and $w_{2 m+1+i}=w_{i}$. Since
every realization of $S$ does not contain a $C_{2 m+2}$, by Lemma(a), for any $v \notin C_{2 m+1}$, there is not $w_{r}, w_{r+1}$ such that $w_{r} v, w_{r+1} v \in E(G)$. Since for any $x, y \notin C_{2 m+1}, x y \notin E(G), d(x)=d(y)=m$, then $x, y$ are all adjacent to $m$ vertices of $C_{2 m+1}$. Assume without loss of generality $w_{1} x, w_{4} x, w_{6} x, \cdots, w_{2 m} x \in E(G)$.

Case 1. Suppose there is $y \notin C_{2 m+1}, y \neq x$ such that there is a $w_{i} \in C_{2 m+1}$ such that $w_{i} x \in E(G), w_{i} y \notin E(G)$.

Subcase 1. Suppose $w_{2} y \in E(G)$. By Lemma(a), $w_{3} y, w_{1} y \notin E(G)$ and at most one vertex of $w_{4}, w_{5}$ is adjacent to $y$. If $w_{6} y \in E(G)$, then $G$ contains a $C_{2 m+2}: w_{6} w_{7} \cdots w_{2 m+1} w_{1} x w_{4} w_{3} w_{2} y w_{6}$. This is a contradiction, thus $w_{6} y \notin E(G)$. Next, if $w_{7} y \in E(G)$, then by Lemma(a), $w_{8} y, w_{6} y \notin E(G)$. Since $y$ is adjacent to $m$ vertices of $C_{2 m+1}$, Lemma(a) forces $w_{9} y, w_{11} y, \cdots, w_{2 m+1} y \in E(G)$. Then $G$ contains a $C_{2 m+2}: w_{2 m+1} y$ $w_{2} w_{1} x w_{4} w_{5} \cdots w_{2 m} w_{2 m+1}$. This is a contradiction, thus $w_{7} y \notin E(G)$. Finally, suppose $w_{6} y, w_{7} y \notin E(G)$. Then, by Lemma(a), $y$ at most is adjacent to $m-1$ vertices of $C_{2 m+1}$ - a contradiction.

Subcase 2. Suppose $w_{3} y \in E(G)$. By a similar method as Subcase 1 we can give a contradiction.

Subcase 3. Suppose $w_{2} y, w_{3} y \notin E(G)$. Lemma(a) forces $y$ to be adjacent to the following $m$ vertices of $C_{2 m+1}: w_{1}, w_{4}, w_{6}, \cdots, w_{2 m}$. This contradicts the supposition of case 1 .

Case 2. Suppose for any $y \notin C_{2 m+1}, y \neq x$, for any $w_{i} \in C_{2 m+1}$, if $w_{i} x \in E(G)$, then $w_{i} y \in E(G)$. Then $w_{1} y, w_{4} y, w_{6} y, \cdots, w_{2 m} y \in E(G)$.

Subcase 1. Suppose $w_{2} w_{5} \in E(G)$. Then $G$ contains a $C_{2 m+2}$ : $w_{5} w_{2} w_{3} w_{4} x w_{1} w_{2 m+1} w_{2 m} \cdots w_{5}$. This is a contradiction.

Subcase 2. Suppose $w_{2 m+1} w_{2} \in E(G)$. Then $G$ contains a $C_{2 m+2}$ : $w_{2} w_{2 m+1} w_{1} x w_{2 m} w_{2 m-1} \cdots w_{2}$. This is a contradiction.

Subcase 3. Suppose there is an $i(3 \leq i \leq m-1)$ such that $w_{2} w_{2 i+1} \in$ $E(G)$. Then $G$ contains a $C_{2 m+2}: w_{2 i+1} w_{2} w_{3} w_{4} \cdots w_{2 i-2} x w_{1} w_{2 m+1} w_{2 m} \cdots$ $w_{2 i+2} y w_{2 i} w_{2 i+1}$. This is a contradiction.

Subcase 4. Suppose $w_{3} w_{5} \in E(G)$. Then $G$ contains a $C_{2 m+2}$ : $w_{3} w_{5} w_{4} x w_{6} w_{7} \cdots w_{2 m+1} w_{1} w_{2} w_{3}$. This is a contradiction.

Subcase 5. Suppose $w_{3} w_{2 m+1} \in E(G)$. Then $G$ contains a $C_{2 m+2}$ : $w_{2 m+1} w_{3} w_{2} w_{1} x w_{4} w_{5} \cdots w_{2 m} w_{2 m+1}$. This is a contradiction.

Subcase 6. Suppose there is an $i(3 \leq i \leq m-1)$ such that $w_{3} w_{2 i+1} \in$ $E(G)$. Then $G$ contains a $C_{2 m+2}: w_{2 i+1} w_{3} w_{2} w_{1} x w_{4} w_{5} \cdots w_{2 i} y w_{2 m} w_{2 m-1}$
$\cdots w_{2 i+1}$. This is a contradiction.
Subcase 7. Suppose there is a $j(2 \leq j \leq m-1)$ such that $w_{2 j+1} w_{2 m+1} \in$ $E(G)$. Then $G$ contains a $C_{2 m+2}: w_{2 j+1} w_{2 m+1} w_{2 m} \cdots w_{2 j+2} x w_{1} w_{2} \cdots$ $w_{2 j+1}$. This is a contradiction.

Subcase 8. Suppose there is a $j$ and an $i(2 \leq j<i \leq m-1)$ such that $w_{2 j+1} w_{2 i+1} \in E(G)$. Then $G$ contains a $C_{2 m+2}: w_{2 j+1} w_{2 i+1} w_{2 i} \cdots w_{2 j+2}$ $x w_{2 i+2} w_{2 i+3} \cdots w_{2 m+1} w_{1} w_{2} \cdots w_{2 j} w_{2 j+1}$. This is a contradiction.

Subcase 9. Suppose for any $i(2 \leq i \leq m), w_{2} w_{2 i+1}, w_{3} w_{2 i+1} \notin E(G)$, and for any $i, j(2 \leq j<i \leq m), w_{2 j+1} w_{2 i+1} \notin E(G)$.

Then

$$
\begin{aligned}
& d\left(w_{2}\right), d\left(w_{3}\right) \leq m+1 \\
& d\left(w_{5}\right), d\left(w_{7}\right), \cdots, d\left(w_{2 m+1}\right) \leq m
\end{aligned}
$$

Since for any $y \notin C_{2 m+1}, d(y)=m$. Hence

$$
\begin{aligned}
\sigma(S) \leq & m(n-2 m-1)+d\left(w_{2}\right)+d\left(w_{3}\right)+d\left(w_{5}\right)+d\left(w_{7}\right) \\
& +\cdots+d\left(w_{2 m+1}\right)+d\left(w_{1}\right)+d\left(w_{4}\right)+d\left(w_{6}\right)+\cdots+d\left(w_{2 m}\right) \\
\leq & m(n-2 m-1)+2(m+1)+m(m-1)+(n-1) m \\
= & (n-2 m-1+2+m-1+n-1) m+2 \\
= & m(2 n-m-1)+2
\end{aligned}
$$

Theorem 3. Let $m \geq 2$. If $k=2 m+1, n \geq 3 m$, then $\sigma\left(C_{k}, n\right)=$ $m(2 n-m-1)+2$; if $k=2 m+2, n \geq 3 m$, then $\sigma\left(C_{k}, n\right) \leq m(2 n-m-$ 1) $+2 m+2$.

Proof. By [5] theorem 2 and $3, \sigma\left(C_{5}, n\right)=4 n-4$ for $n \geq 5, \sigma\left(C_{6}, n\right)=$ $4 n-2$ for $n \geq 7$. Clearly $\sigma\left(C_{6}, 6\right)=24$. Hence for $m=2$, if $k=$ $2 m+1, n \geq 3 m$, then $\sigma\left(C_{k}, n\right) \leq m(2 n-m-1)+2$; if $k=2 m+2, n \geq 3 m$, then $\sigma\left(C_{k}, n\right) \leq m(2 n-m-1)+2 m+2$.

Suppose for $\mathrm{t}, 2 \leq t<m$, if $k=2 t+1, n \geq 3 t$, then $\sigma\left(C_{k}, n\right) \leq$ $t(2 n-t-1)+2$ and if $k=2 t+2, n \geq 3 t$, then $\sigma\left(C_{k}, n\right) \leq t(2 n-t-1)+2 t+2$.

Case 1. If $S$ is an n-term graphical sequence, with $k=2 m+1, n \geq$ $3 m, \sigma(S) \geq m(2 n-m-1)+2$. For $n=3 m, \sigma(S) \geq m(6 m-m-1)+2=$ $5 m^{2}-m+2=2\left[\binom{k-1}{2}+\binom{n-k+2}{2}+1\right]$, which by [1] (chapter III, theorem 5.9) implies that all realizations of $S$ contain a $C_{k}$. Now assume that $S_{1}$ is a p-term graphical sequence, $3 m \leq p<n, \sigma\left(S_{1}\right) \geq m(2 p-m-1)+2$ and that there is a realization of $S_{1}$ containing a $C_{k}$. We will show that if $S=\left(d_{1}, d_{2}, \ldots, d_{p+1}\right)$ is a $p+1$-term graphical sequence with realization $G$
and $\sigma(S) \geq m(2(p+1)-m-1)+2$, then $S$ has a realization containing a $C_{2 m+1}$. Assume $d_{1} \geq d_{2} \geq \cdots \geq d_{n} \geq 0$. Let $S^{\prime}$ be the degree sequence of $G-v_{p+1}$ and suppose $d_{p+1} \leq m$. Then $\sigma\left(S^{\prime}\right) \geq m(2(p+1)-m-1)+2-2 m=$ $m(2 p-m-1)+2$. Therefore, by our assumption, $S^{\prime}$ has a realization containing a $C_{k}$. Hence $S$ has a realization containing a $C_{k}$. Thus, we may assume that $d_{p+1} \geq m+1$. Since $\sigma(S) \geq m(2(p+1)-m-1)+2 \geq$ $(m-1)(2(p+1)-(m-1)-1)+2(m-1)+2$, by our assumption, there is a realization of $S$ containing a $C_{2 m}$. Which by theorem 1 implies that $S$ has a realization containing a $C_{2 m+1}$.

Case 2. If $k=2 m+2, n \geq 3 m, S$ is an $n$-term graphical sequence with $\sigma(S) \geq m(2 n-m-1)+2 m+2$ then we can prove, via a similar method as Case 1, that $S$ has a realization containing a $C_{2 m+2}$.

Hence $\sigma\left(C_{2 m+1}, n\right) \leq m(2 n-m-1)+2, \sigma\left(C_{2 m+2}, n\right) \leq m(2 n-m-$ 1) $+2 m+2$.

By [5], theorem 1 (Theorem A below), for $m \geq 2, k=2 m+1, n \geq 2 m+$ $1, \sigma\left(C_{k}, n\right) \geq m(2 n-m-1)+2$. Hence, for $m \geq 2$, if $k=2 m+1, n \geq 3 m$, then $\sigma\left(C_{k}, n\right)=m(2 n-m-1)+2$.

Lemma 4. If $m \geq 3, n=3 m+t(t=0,1,2, \cdots, 2 m-2)$, then $\sigma\left(C_{2 m+2}, n\right) \leq m(2 n-m-1)+2 m+2-2\left[\frac{t}{2}\right]$.

Proof. By theorem 3, Lemma 4 holds for $t=0,1$. Now assume that Lemma 4 holds for all $t-1,(1 \leq t \leq 2 m-2)$. We now prove that Lemma holds for $t$.

Let $S=\left(d_{1}, d_{2}, \ldots, d_{n}\right)$ be an $n$-term graphical sequence $(n=3 m+t)$, $G$ a realization of $S$ and $\sigma(S) \geq m(2 n-m-1)+2 m+2-2\left[\frac{t}{2}\right]$. Assume $d_{1} \geq d_{2} \geq \cdots \geq d_{n} \geq 0$.

Let $S^{\prime}$ be the degree sequence of $G-v_{n}$. If $d_{n} \leq m-1$, then $\sigma\left(S^{\prime}\right) \geq$ $m(2 n-m-1)+2 m+2-2\left[\frac{t}{2}\right]-2(m-1) \geq m(2(n-1)-m-1)+2 m+2-2\left[\frac{t-1}{2}\right]$. By induction suppose, $S^{\prime}$ has a realization containing a $C_{2 m+2}$. Hence $S$ has a realization containing a $C_{2 m+2}$. Thus, we may assume that $d_{n} \geq m$. Since $t \leq 2 m-2$, one has $\sigma(S) \geq m(2 n-m-1)+2 m+2-2\left[\frac{t}{2}\right]>m(2 n-m-1)+2$. This implies, by theorem 3 , that $S$ has a realization containing a $C_{2 m+1}$. Let $w \in C_{2 m+1}, x, y \notin C_{2 m+1}$ and assume that every realization of $S$ does not contain a $C_{2 m+2}$. If $d(x) \geq m+1$, then since $d(w) \geq d_{n} \geq 3$, by theorem 1, $S$ has a realization containing a $C_{2 m+2}$. This is a contradiction. Hence for any $x \notin C_{2 m+1}, d(x)=m$.

If for any $x, y \notin C_{2 m+1}, x y \notin E(G)$, then, by theorem $2, \sigma(S) \leq m(2 n-$ $m-1)+2<m(2 n-m-1)+2 m+2-2\left[\frac{t}{2}\right] \leq \sigma(S)$. This is a contradiction.

Thus, we may assume that there is $x, y \notin C_{2 m+1}$ such that $x y \in E(G)$. Let $S^{\prime}$ be degree sequence of $G-\{x, y\}$. Since $d(x)=d(y)=m$, then $\sigma\left(S^{\prime}\right) \geq$ $m(2 n-m-1)+2 m+2-2\left[\frac{t}{2}\right]-4 m+2=m(2(n-2)-m-1)+2 m+2-2\left[\frac{t-2}{2}\right]$. By induction suppose, $S^{\prime}$ has a realization containing a $C_{2 m+2}$. Hence $S$ has a realization containing a $C_{2 m+2}$. This is a contradiction.

Therefore $\sigma\left(C_{2 m+2}, n\right) \leq m(2 n-m-1)+2 m+2-2\left[\frac{t}{2}\right]$.
Theorem 5. $\sigma\left(C_{2 m+2}, n\right)=m(2 n-m-1)+4$, for $m \geq 3, n \geq 5 m-2$.
Proof. By Lemma 4 , for $m \geq 3, n=5 m-2, \sigma\left(C_{2 m+2}, n\right) \leq m(2 n-$ $m-1)+2 m+2-2\left[\frac{2 m-2}{2}\right]=m(2 n-m-1)+4$.

Suppose for $p,(5 m-2 \leq p<n), \sigma\left(C_{2 m+2}, p\right) \leq m(2 p-m-1)+4$. Let $S=\left(d_{1}, d_{2}, \ldots, d_{n}\right)$ be an $n$-term graphical sequence with realization $G$ and $\sigma(S) \geq m(2 n-m-1)+4$. Assume $d_{1} \geq d_{2} \geq \cdots d_{n} \geq 0$.

If $d_{n} \leq m$, then consider the degree sequence, $S^{\prime}$, formed by $G-v_{n}$. Then $\sigma\left(S^{\prime}\right) \geq m(2 n-m-1)+4-2 m=m(2(n-1)-m-1)+4$. By the induction hypothesis, $S^{\prime}$ has a realization containing a $C_{2 m+2}$. Hence $S$ has a realization containing a $C_{2 m+2}$. Thus, we may assume that $d_{n} \geq m+1$. Since $\sigma(S) \geq m(2 n-m-1)+4 \geq m(2 n-m-1)+2$, theorem 3 implies that $S$ has a realization containing a $C_{2 m+1}$. Therefore, by theorem $1, S$ has a realization containing a $C_{2 m+2}$.

Therefore $\sigma\left(C_{2 m+2}, n\right) \leq m(2 n-m-1)+4$.
By [5] theorem 1 (Theorem A below), for $m \geq 2, n \geq 2 m+2, \sigma\left(C_{2 m+2}, n\right)$ $\geq m(2 n-m-1)+4$. Hence $\sigma\left(C_{2 m+2}, n\right)=m(2 n-m-1)+4$ for $m \geq 3, n \geq 5 m-2$.

For completeness, we give a short proofs of the lower bounds for $\sigma\left(C_{2 m+1}, n\right)$ and $\sigma\left(C_{2 m+2}, n\right)$ as following:

Theorem A. $\sigma\left(C_{2 m+1}, n\right) \geq m(2 n-m-1)+2$, for $n \geq 2 m+1, m \geq 2$, $\sigma\left(C_{2 m+2}, n\right) \geq m(2 n-m-1)+4$, for $n \geq 2 m+2, m \geq 2$.

Proof. By noting that $G=K_{m}+\overline{K_{n-m}}$ gives a uniquely realizable degree sequence and $G$ clearly does not contain $C_{2 m+1}, H=K_{m}+$ ( $\overline{K_{n-m-2}} \bigcup K_{2}$ ) gives a uniquely realizable degree sequence and $H$ clearly does not contain $C_{2 m+2}$, this result can easily be seen.

## Acknowledgment

This paper was written in the University of Science and Technology of China as a visiting scholar. The author thanks Prof. Li Jiong-sheng for his advice. The author thanks the referees for many helpful comments.
