#### Abstract

This paper starts with the study of velocity transmission in a queue. We assume that the velocity of an element in a queue and the distance between the two adjacent elements satisfies a linear relation. Based upon this assumption, models are built to mathematically analyze the influence of the acceleration (or deceleration) of the first object in the sequence to the following objects. The computer program Mathematica ${ }^{\circledR}$ is used to help with the calculation. The final results are presented by a function based on Gamma Function and can also be described by the Velocity-Time graph of every element. Real statistics are used to verify the model.

Secondly, on the basis of the similarities between the flow of vehicles in traffic and the movement of elements in a queue, the model is applied in traffic forecast. Statistics are taken into consideration to modify the model, which contributes to expecting the expansion of traffic congestion, in terms of both velocity and extent.

Finally, by studying the price relation in an industrial chain, the model is also used to analyze the influence that the price fluctuation of an upstream product may bring to the price of downstream products. In this way, the model can be applied in traffic dispatch, fluctuation prediction and many other fields in real life.

Key words: Queue; transmission of velocity; traffic congestion; industrial chain; price fluctuation

## Chapter I

## Introduction

With its glamorous exhibitions and heart-warming services, the 2010 Shanghai World Expo attracted over 70 million visitors from all over the world. When we were paying a visit, however, it was not the Expo itself that fascinated us most. It was an idea that we came across while lining up in the queue: each move of a queue is actually caused by the move of the first person in the queue. In other words, when the first person accelerates, his or her velocity is passed on to every following person. Thus, given the velocity of the first person and the distances between every two people, we can build a model to mathematically analyze the motion of the queue.

There are many similar situations in our real life where velocity transmission occurs. To quote an example, in a traffic congestion, it is the first car's sudden stop that causes every following car to stop their motion. In these cases, our model can be used to efficiently predict the velocity and distance of the spread of the congestion. Similarities can also be seen in the transmission of price fluctuation in an industrial chain. In this situation, our model contributes to the prediction of the price change in downstream products.

In a word, we believe that the Model of Velocity Transmission in a Queue extends from pure mathematics to the field of application. It indeed is an art of anticipation, as well as a question of balance. Today, when we are all heading for a more efficient society, we sincerely hope that by mathematical methods, we can understand the world in a more sensible way. We are glad to use our own knowledge and efforts to solve the challenges that we are facing. We believe that in the near future, mathematics will play even a more significant role in our joint venture: making this world a better place.

## Chapter II :

## Modeling: Velocity Transmission in a Queue

### 2.1 Preliminary

### 2.1.1 Gamma Function

Gamma function (represented by the capital Greek letter $\boldsymbol{\Gamma}$ ) is an extension of the factorial function, with its argument shifted down by 1 , to real and complex numbers.

- The Gamma function is defined as
$\operatorname{Gamma}[z]=\int_{0}^{\infty} t^{z-1} e^{-t} d t$
- The incomplete gamma function is defined as
$\operatorname{Gamma}[a, z]=\int_{z}^{\infty} t^{a-1} e^{-t} d t$

### 2.1.2 Notation

$n$ The total number of elements in a queue
$a_{i}$ The $i$-th element in a queue
$S_{i} \quad$ The distance between $a_{i}$ and $a_{i+1}$
$V_{i}$ The velocity of $a_{i}$

### 2.2 Mathematical Model and Its Solution

### 2.2.1 Velocity Transmission during Acceleration

First, let us consider how the velocity transmits in a straight line after the first element starts to move. We assume that there are $n$ elements in a queue. Number the $n$ elements as $a_{1}, a_{2}, a_{3}, \cdots, a_{n}$. When the queue remains still, the distance between every two adjacent elements is assumed to be the same (denoted by $S_{0}$ ). When the distance is less than a certain value (denoted by $S^{\prime}$ ), $V_{i}$ changes linearly with $S_{i-1}$; When $S_{i}>S^{\prime}$, the later element moves at its maximum velocity (denoted by $V^{\prime}$ ), i.e., its velocity remains a fixed value.

We assume that the relation between $V$ and $S$ satisfies

$$
V_{i}=f\left(S_{i-1}\right), \quad i=2,3, \cdots, n
$$

(Figure 2.1)
To simplify the calculation, we assume that the relation between $V_{i}$ and $S_{i-1}$ satisfies (as shown in figure 2.1)

$$
V_{i}=f\left(S_{i-1}\right)=\left\{\begin{array}{ll}
k\left(S_{i-1}-S_{0}\right) & \mathrm{S}_{i-1} \in\left[0, \mathrm{~S}^{\prime}\right) \\
V^{\prime} & \mathrm{S}_{i-1} \in\left[\mathrm{~S}^{\prime},+\infty\right)
\end{array},\right.
$$

where $k, V^{\prime}, S_{0}, S^{\prime}$ are all positive constants.
When $t=0$, we have

$$
\begin{aligned}
& S_{1}=S_{2}=S_{3}=\cdots=S_{i}=S_{0} \\
& V_{1}=V^{\prime} \quad V_{2}=V_{3}=\cdots=V_{i}=0
\end{aligned}
$$

Now let's consider what the distance $S_{i}$ of every elements in a queue is at time $t$. For the first element, we have

$$
V_{1}=V^{\prime} \quad S_{1}=S_{0}+V^{\prime} t-\int_{0}^{t} V_{2} d t
$$

( $S_{1}$ can be determined by adding the distance that $a_{1}$ has traveled to the initial value $S_{0}$, then subtracting the distance that $a_{2}$ has traveled.)

For the second element $a_{2}$, we have

$$
\begin{equation*}
V_{2}=f\left(s_{1}\right)=k\left(V^{\prime} t-\int_{0}^{t} V_{2} d t\right) \tag{2.1}
\end{equation*}
$$

(In an infinitesimally small period of time after $a_{1}$ starts, $V_{2}$ will not exceed $V^{\prime}$.

Namely, $V_{2}=k\left(S_{1}-S_{0}\right)$. We first consider how elements move under this circumstance.)
Differentiating (2.1), we obtain,

$$
\begin{aligned}
& \frac{d V_{2}}{d t}=k\left(V^{\prime}-V_{2}\right) \\
\Leftrightarrow & \frac{1}{V^{\prime}-V_{2}} d V_{2}=k d t
\end{aligned}
$$

Integrating both sides with respect to $t$, we have

$$
\ln \left(\frac{1}{V^{\prime}-V_{2}}\right)=k t+C
$$

Given that when $t=0, V_{2}=0$, we obtain

$$
\begin{aligned}
& C=\ln \left(\frac{1}{V^{\prime}}\right) \\
& \therefore \quad \ln \left(\frac{1}{V^{\prime}-V_{2}}\right)=k t+\ln \left(\frac{1}{V^{\prime}}\right)
\end{aligned}
$$

Therefore, $V_{2}$ satisfies

$$
\begin{equation*}
V_{2}=V^{\prime}\left(1-e^{-k t}\right) \tag{2.2}
\end{equation*}
$$

(From the expression (2.2), we can see that when the infinitesimally small period of time extends, $V_{2}$ will still be less than $V^{\prime}$. Only when $t \rightarrow+\infty, V_{2} \rightarrow V^{\prime}$.)

By the definition of distance, we have

$$
S_{2}=S_{0}+\int_{0}^{t} V_{2} d t-\int_{0}^{t} V_{3} d t
$$

According to the assumption,

$$
\begin{equation*}
V_{3}=k\left(S_{2}-S_{0}\right)=k\left(\int_{0}^{t} V_{2} d t-\int_{0}^{t} V_{3} d t\right) \tag{2.3}
\end{equation*}
$$

Substituting (2.2) into (2.3), we have

$$
k\left(V^{\prime} t-\int_{0}^{t} V_{3} d t\right)=V^{\prime}\left(1-e^{-k t}\right)+V_{3}
$$

Therefore, $V_{3}$ satisfies

$$
V_{3}=V^{\prime}\left(1-e^{-k t}(1+k t)\right)
$$

Similarly, we obtain

$$
\begin{aligned}
& V_{4}=V^{\prime}\left[1-e^{-k t}\left(1+k t+\frac{1}{2} k^{2} t^{2}\right)\right] \\
& V_{5}=V^{\prime}\left[1-e^{-k t}\left(1+k t+\frac{1}{2} k^{2} t^{2}+\frac{1}{6} k^{3} t^{3}\right)\right]
\end{aligned}
$$

By induction on $i$,

$$
V_{i}=V^{\prime}\left(1-e^{-k t} \sum_{j=0}^{i-2} \frac{k^{j} t^{j}}{j!}\right)
$$

Using Gamma function to simplify the equation, we have

$$
\begin{equation*}
V_{i}=V^{\prime}\left(1-\frac{\operatorname{Gamma}[i-1, k t]}{\operatorname{Gamma}[i-1]}\right) \tag{2.4}
\end{equation*}
$$

We use Mathematica ${ }^{\circledR}$ to plot function (2.4):

### 2.2.2 Velocity Transmission during Deceleration

Now we discuss how the velocity transmits when the first element suddenly stops.
We assume that from the moment $T$, the velocity of the first element suddenly becomes 0 .
Under this circumstance, we have

$$
V_{1}=0 \quad S_{1}=S_{0}+V^{\prime} T-\int_{0}^{T} V^{\prime}\left(1-e^{-k t}\right) d t-\int_{T}^{t} V_{2} d t
$$

Given that

$$
V_{2}=f\left(s_{1}\right)=k\left(V^{\prime} T-\int_{0}^{T} V^{\prime}\left(1-e^{-k t}\right) d t-\int_{T}^{t} V_{2} d t\right)
$$

And that when $t=T$,

$$
\int_{0}^{T} V^{\prime}\left(1-e^{-k t}\right) d t=V^{\prime}\left(\frac{-1+e^{-k T}}{k}+T\right),
$$

we have

$$
V_{2}=V^{\prime} e^{-k t}\left(-1+e^{k T}\right)
$$

Similarly,

$$
\begin{aligned}
& V_{3}=V^{\prime} e^{-k t}\left(-k(t-T)+e^{k T}(1+k(t-T)-\operatorname{Gamma}[2, k T])\right) \\
& V_{4}=V^{\prime} e^{-k t}\left(-k(t-T)-\frac{1}{2} k^{2}\left(t^{2}-T^{2}\right)+e^{k T}\left(1+k(t-T)+\frac{1}{2} k^{2}(t-T)^{2}-\frac{1}{2} \operatorname{Gamma}[3, k T]\right)\right)
\end{aligned}
$$

$$
\begin{aligned}
& V_{5}=V^{\prime} e^{-k t}\left(-k(t-T)-\frac{1}{2} k^{2}\left(t^{2}-T^{2}\right)-\frac{1}{6} k^{3}\left(t^{3}-T^{3}\right)\right)+ \\
& \left.e^{k T}\left(1+k(t-T)+\frac{1}{2} k^{2}(t-T)^{2}+\frac{1}{6} k^{3}(t-T)^{3}-\frac{1}{6} G a m m a[4, k T]\right)\right)
\end{aligned}
$$

By induction on $i$, we have

$$
\begin{aligned}
& V_{i}=V^{\prime} e^{-k t}\left(-\sum_{j=1}^{i-2} \frac{1}{j!} k^{j}\left(t^{j}-T^{j}\right)+e^{k T}\left(\sum_{j=0}^{i-2} \frac{1}{j!} k^{j}(t-T)^{j}-\frac{1}{(i-2)!} e^{-k T} \sum_{j=1}^{i-1} \frac{(i-2)!k^{j-1} T^{j-1}}{(j-1)!}\right)\right) \\
\Leftrightarrow & V_{i}=V^{\prime} e^{-k t}\left(-\sum_{j=1}^{i-2} \frac{k^{j} t^{j}}{j!}+e^{k T} \sum_{j=0}^{i-2} \frac{k^{j}(t-T)^{j}}{j!}-1\right)
\end{aligned}
$$

Using Gamma function to simplify the equation, we have

$$
\begin{equation*}
V_{i}=\frac{V^{\prime}(-\operatorname{Gamma}[i-1, k t]+\operatorname{Gamma}[i-1, k(t-T)])}{\operatorname{Gamma}[i-1]} \tag{2.5}
\end{equation*}
$$

Therefore, given the equations (2.4), (2.5), $V_{i}$ can be presented as:

$$
V_{i}=\left\{\begin{array}{ll}
V^{\prime}\left(1-\frac{\operatorname{Gamma}[i-1, k t]}{\operatorname{Gamma}[i-1]}\right) & t \in[0, T) \\
\frac{V^{\prime}(-G a m m a[i-1, k t]+\operatorname{Gamma}[i-1, k(t-T)])}{\operatorname{Gamma}[i-1]} & t \in[T,+\infty)
\end{array},\right.
$$

where $i, k, V^{\prime}$ are all positive constants.
We use Mathematica ${ }^{\circledR}$ to produce the following graph:

(Figure 2.3)

### 2.3 Verification

To verify the model, we investigated a real case of Velocity Transmission in a Queue. We took a video at the China Pavilion, 2010 Shanghai World Expo. From the video, we took down the positions at different time $t$ of the first twenty people in the queue. We use the statistics to plot the Velocity-Time graphs of the twenty people. Combining the $V-t$ graphs and the curves of $V_{i}$, we have the results below:

v18 (pixel /s)

v19 (pizel /s)

(Figure 2.4)
*In the function of $V_{i}$, the parameters are $k \rightarrow 1.45, V^{\prime} \rightarrow 50, T \rightarrow 6$.
From Figure (2.4) we can see that the model is verified. Although when $i \leq 3$, velocity transmission may not strictly follow our assumption, for it can be interfered by many other factors, the function in general can well describe the motion of the people in a queue. Thus, we consider the model a good reflection of reality.

### 2.4 Conclusion

From the discussion above, we can see that the change of velocity of the first element in a queue can be transmitted to all subsequent elements. The longer the distance between $a_{i}$ and $a_{0}$ is, the smaller the range of the change of its velocity appears to be. The delay of the transmission is also illustrated by Figure 2.3, where the function of $V_{i}$ satisfies

$$
V_{i}= \begin{cases}V^{\prime}\left(1-\frac{\text { Gamma }[i-1, k t]}{\text { Gamma }[i-1]}\right) & t \in[0, T) \\ \frac{V^{\prime}(-\operatorname{Gamma}[i-1, k t]+\operatorname{Gamma}[i-1, k(t-T)])}{\operatorname{Gamma}[i-1]} & t \in[T,+\infty)\end{cases}
$$

## Chapter III: Application 1

## The Spread of Traffic Congestion

### 3.1 Study Background

Nowadays, cities have been bothered by traffic congestion. At rush hours, the traffic becomes so heavy that congestion in a comparatively small area, if not directed in time, will soon expand. Thus, traffic jam can cause great trouble for the traffic department. It is also a waste of people's time. On the basis of the similarities between these circumstances and our model, the Model of Velocity Transmission in a Queue can be used to forecast the spread of traffic congestion. We can ultimately predict how fast and how far the congestion will spread. According to the result, concerned department will be able to take measures in advance.

### 3.2 Modeling \& Calculation

We assume that there are $n$ cars traveling along a straight track. The distances between every two adjacent cars are the same. Now, traffic congestion takes place at the front-end of the queue due to some unpredictable reasons. We further assume that the initial velocity of all cars is a constant $V^{\prime}$, and that the distance between every two adjacent cars $S_{i}=S^{\prime}=\frac{V^{\prime}}{k}+S_{0}$. Let the velocity of the first car turn zero at $\mathrm{t}=0$.

According to the model,

$$
\begin{align*}
& V_{i}=V^{\prime} e^{-k t} \sum_{j=0}^{i-2} \frac{k^{j} t^{j}}{j!} \\
& V_{i}=\frac{V^{\prime}(i-1) \operatorname{Gamma}[i-1, k t]}{\operatorname{Gamma}[i]} \tag{3.1}
\end{align*}
$$

We use Mathematica ${ }^{\circledR}$ to obtain the figure below:

(Figure 3.1)

Figure 3.1 presents us with the Velocity-Time graph of every car.
As in the idealized model the velocity of any of the cars will not decrease to zero, we introduce $b=\frac{V_{i}}{V^{\prime}}$. When $b \leq b_{0}$, the car is regarded to be in a state of stillness.

To illustrate the main idea of the solution, we take, for example, (In real cases, the constants need to be changed to adapt to different circumstances.)

$$
\begin{aligned}
& V^{\prime}=20(\mathrm{~m} / \mathrm{s}) \\
& k=0.44\left(\mathrm{~s}^{-1}\right) \\
& S_{0}=5(\mathrm{~m}) \\
& S^{\prime}=50(\mathrm{~m}) \\
& b_{0}=0.05
\end{aligned}
$$

Substituting the constants above into (3.1), we obtain the value of $i$ (representing the serial number of the car that stops at time $t$ ). The resulting sequence of $i$ is depicted by Figure 3.2.

Since

$$
V=\frac{d S}{d t}=\frac{d i}{d t}=\operatorname{Lim}_{d t \rightarrow 0} \frac{f[t+d t]-f[t]}{d t}
$$

We have

| $b$ | $t$ | $f[t]$ | $f[t+d t]$ | $V_{p}$ |
| :---: | :---: | :---: | :---: | :---: |

| 0.05 | 1225 | 502.6014 | 502.6018 | 0.424411 |

(Table 3.1)

Using the figures in the table, we have

(Figure 3.3)

From Figure (3.3), it can be seen that the transmission velocity of the phase is an increasing function of Time. Its slope appears to be decreasing. We then use the method of Least Square to fit the data.

We find that the function can be best fitted by the equation $V=a t^{c} \operatorname{Ln}(t)+b$. Using the computer program Mathematica ${ }^{\circledR}$ to solve this equation, we have

$$
\mathrm{a} \rightarrow 0.11237237, \mathrm{~b} \rightarrow 0.09181098, \mathrm{c} \rightarrow-0.12348419
$$

$$
\begin{equation*}
V_{p}=0.11237237 t^{-0.123484} \operatorname{Ln}(t)+0.09181098 \tag{3.2}
\end{equation*}
$$

Using computer to plot the function, we have

(Figure 3.4)

(Figure 3.5)
From Figure (3.4) and (3.5), we can see when $t>50$, the data are well fitted. When $t<50$, there is a deviation of the function from the statistics.
Then we calculate the distance that traffic congestion (the status at which a car moves
at a relatively low velocity, which is $b \cdot V^{\prime}$ ) travels.
Considering the relation between the distance that traffic congestion travels (denoted by $D_{p}$ ) and the distance that $a_{i}$ travels (denoted by $D_{i}$ ), we have

$$
D_{p}=(i-1) S_{0}-D_{i}
$$

Integrating (3.1), we have

$$
\begin{aligned}
D_{i} & =\int_{0}^{t} V_{i} d t=\int_{0}^{t} \frac{V^{\prime}(i-1) \operatorname{Gamma}[i-1, k t]}{\operatorname{Gamma}[i]} d t \\
D_{i} & =\frac{V^{\prime}(k t G a m m a[i-1, k t]+\operatorname{Gamma}[i, 0]-\operatorname{Gamma}[i, k t])}{k G a m m a[i-1]}
\end{aligned}
$$

Similarly, by integrating (3.2), we get

(Figure 3.6)
From Figure (3.6) we note that there is deviation from the fitted curve to the given data points. Thus we come to update the fitting.
Let $i=a t+b t^{c}(d+e \operatorname{Ln}[t])$. We find the fitting constants below using the method of Least Square:

$$
\begin{aligned}
& \mathrm{a} \rightarrow-3.4553978, \mathrm{~b} \rightarrow 0.99490992, \mathrm{c} \rightarrow 0.95957738 \\
& \mathrm{~d} \rightarrow 3.5569785, \mathrm{e} \rightarrow 0.22815992
\end{aligned}
$$

Hence, the function $i$ can be written as:

$$
\begin{equation*}
i=-3.455398 t+0.99490992 t^{0.95957738}(3.5569785+0.22815992 \operatorname{Ln}[t]) \tag{3.3}
\end{equation*}
$$

Having plotted the function in Figure (3.7), we can see that the original statistics are better fitted with the function.

Substituting $i$ into the formula of $D_{i}$, we have

$$
\begin{aligned}
D_{i}= & V^{\prime}\left(k t \text { Gamma }\left[-3.455 t+0.995 t^{0.9596}(3.557+0.22816 \operatorname{Ln}[t])-1, k t\right]\right. \\
& + \text { Gamma }\left[-3.455 t+0.995 t^{0.9596}(3.557+0.22816 \operatorname{Ln}[t]), 0\right] \\
& \left.- \text { Gamma }\left[-3.455 t+0.995 t^{0.9596}(3.557+0.22816 \operatorname{Ln}[t]), k t\right]\right) \\
& /\left(k G a m m a\left[-3.455 t+0.995 t^{0.0596}(3.557+0.22816 \operatorname{Ln}[t])-1\right]\right)
\end{aligned}
$$

Therefore, we get,

$$
\begin{aligned}
D_{p}= & \left(-3.455 t+0.995 t^{0.9596}(3.557+0.22816 \operatorname{Ln}[t])-1\right) S_{0} \\
& -V^{\prime}\left(k t G a m m a\left[-3.455 t+0.995 t^{0.9596}(3.557+0.22816 \operatorname{Ln}[t])-1, k t\right]\right. \\
& + \text { Gamma }\left[-3.455 t+0.995 t^{0.9596}(3.557+0.22816 \operatorname{Ln}[t]), 0\right] \\
& \left.- \text { Gamma }\left[-3.455 t+0.995 t^{0.9596}(3.557+0.22816 \operatorname{Ln}[t]), k t\right]\right) \\
& /\left(k G a m m a\left[-3.455 t+0.995 t^{0.9596}(3.557+0.22816 \operatorname{Ln}[t])-1\right]\right)
\end{aligned}
$$

Substituting the following data:

$$
\begin{aligned}
& V^{\prime}=20(\mathrm{~m} / \mathrm{s}) \\
& k=0.44\left(\mathrm{~s}^{-1}\right) \\
& S_{0}=5(\mathrm{~m}) \\
& S^{\prime}=50(\mathrm{~m})
\end{aligned}
$$

We have

$$
\begin{align*}
& D_{p}=-45.4545+176.94 t^{0.9596}-172.77 t \\
& -\left(45.45\left(0.44 t \text { Gamma }-3.455 t+0.995 t^{0.9596}(3.557+0.22816 \operatorname{Ln}[t])-1,0.44 t\right]\right. \\
& + \text { Gamma }\left[-3.455 t+0.995 t^{0.9596}(3.557+0.22816 \operatorname{Ln}[t]), 0\right]  \tag{3.4}\\
& \left.\left.- \text { Gamma }\left[-3.455 t+0.995 t^{0.9596}(3.557+0.22816 \operatorname{Ln}[t]), 0.44 t\right]\right)\right) \\
& \text { / Gamma }\left[-3.455 t+0.995 t^{0.9596}(3.557+0.22816 \operatorname{Ln}[t])-1\right]+11.35 t^{0.9596} \operatorname{Ln}[t]
\end{align*}
$$

Now we re-plot the $D_{p}-t$ graph (Figure 3.8). It can be seen that the fitting is enhanced.

(Figure 3.8)
Conclusion:
From (3.2), (3.3), (3.4), we can obtain $V_{p}$ (the velocity at which the traffic congestion spreads) at time $t$ and $D_{p}$ (the spread distance from the original congestion spot).

### 3.3 Application Analysis

From the analyses above, we can see that the model of Velocity Transmission in a Queue can be applied in traffic problems. In real life, we can obtain the initial velocity and distance between cars by investigation. Once given those statistics, we will be able to substitute them in to the function and then calculate the velocity and extent of the congestion transmission. It will be a convenient and accurate way to predict the congestion. With the help of the model, the traffic department could direct the cars in advance, which would be a remedy for the congested area, and thus reduce the negative impact that traffic congestion may bring.

## Chapter IV: Application 2

## The Transmission of Price Fluctuation in an

## Industrial Chain

### 4.1 Study Background

The interaction between the upstream and downstream products in an industrial chain is one of the important topics studied in microeconomics. With a certain product's price going up, change will be brought to the cost of the next part in the chain. And this fluctuation is passed on to every following product, which finally to the increase of CPI and other consumption indexes. In real life, the rise of price may be influenced by many factors, such as financial policies, supply-demand relationship etc. This fact in some way makes the fluctuation unpredictable. Here, we simplify the situation, assuming that the fluctuation in prices of downstream products is only affected by the upstream ones. By calculation, we hope that we can predict the influence that the price fluctuation of an upstream product may bring to the price of downstream products.

### 4.2 Modeling and Computations of the model

We assume that when $t=0$, the price of a benchmark product suddenly changes from $P_{0}$ to $P^{\prime}$. When $t=T$, the price goes back to $P_{0}$.
In the primal model in Chapter II, the longer the distance between $a_{i}$ and $a_{1}$ is, the smaller the influence of the acceleration of $a_{1}$ appears to be. Similarly in this case, we use $n$ to depict this influence. Therefore, The price of the $a$-th product in the chain satisfies $P_{a}=A_{a} \cdot f\left(k_{a}, t\right) . k_{a}$ can be understood as a parameter that indicates how close $P_{a}$ is related to $P_{a-1}$. $A_{a}$ denotes the ratio of the initial $P_{a}$ to $P_{0}$.

From Chapter II, we have
$P_{a}= \begin{cases}A_{a}\left(P_{0}+\left(P^{\prime}-P_{0}\right)\left(1-\frac{\operatorname{Gamma}\left[n_{a}-1, k_{a} t\right]}{\operatorname{Gamma}\left[n_{a}-1\right]}\right)\right) & t \in[0, T) \\ A_{a}\left(P_{0}+\frac{\left(P^{\prime}-P_{0}\right)\left(-\operatorname{Gamma}\left[n_{a}-1, k_{a} t\right]+\operatorname{Gamma}\left[n_{a}-1, k_{a}(t-T)\right]\right)}{\operatorname{Gamma}\left[n_{a}-1\right]}\right) & t \in[T,+\infty)\end{cases}$

Substituting different parameters into the function above, we have the following graphs:

$P_{0} \rightarrow 1, P^{\prime} \rightarrow 5, T \rightarrow 30$
$k_{2} \rightarrow 0.5, k_{3} \rightarrow 0.5, k_{4} \rightarrow 0.5, k_{5} \rightarrow 0.5, k_{6} \rightarrow 0.5$
$A_{2} \rightarrow 1.5, A_{3} \rightarrow 2.0, A_{4} \rightarrow 2.5, A_{5} \rightarrow 3.0, A_{6} \rightarrow 3.5$

$P_{0} \rightarrow 1, P^{\prime} \rightarrow 5, T \rightarrow 30$
$k_{2} \rightarrow 0.2, k_{3} \rightarrow 0.2, k_{4} \rightarrow 0.2, k_{5} \rightarrow 0.2, k_{6} \rightarrow 0.2$
$A_{2} \rightarrow 1.5, A_{3} \rightarrow 2.0, A_{4} \rightarrow 2.5, A_{5} \rightarrow 3.0, A_{6} \rightarrow 3.5$

$P_{0} \rightarrow 1, P^{\prime} \rightarrow 5, T \rightarrow 30$
$k_{2} \rightarrow 0.1, k_{3} \rightarrow 0.2, k_{4} \rightarrow 0.3, k_{5} \rightarrow 0.4, k_{6} \rightarrow 0.5$
$A_{2} \rightarrow 1.5, A_{3} \rightarrow 2.0, A_{4} \rightarrow 2.5, A_{5} \rightarrow 3.0, A_{6} \rightarrow 3.5$

$P_{0} \rightarrow 1, P^{\prime} \rightarrow 5, T \rightarrow 30$
$k_{2} \rightarrow 0.5, k_{3} \rightarrow 0.5, k_{4} \rightarrow 0.5, k_{5} \rightarrow 0.5, k_{6} \rightarrow 0.5$
$A_{2} \rightarrow 1.5, A_{3} \rightarrow 1.6, A_{4} \rightarrow 1.7, A_{5} \rightarrow 1.8, A_{6} \rightarrow 1.9$
(Figure 4.1)
From the graphs, we can see that price fluctuation in upstream products do bring influences to the whole industrial chain. However, when the parameters are different, the results vary accordingly. In some cases, the fluctuation is magnified in the transmission, which means that the fluctuation becomes more obvious. In other cases,
the fluctuation can be digested in the process, making the influence weaker in downstream products.

### 4.3 Case Analysis

Pork price has always been the indicator of consumption prices. Its fluctuation can reflect the price of pig feed, as well as affecting the price of the industrial chain of pork. Now, we use the industrial chain of corn (pig feed)-pork-spare ribs to analyze the price fluctuation in real life.

The table below shows the prices of corn (pig feed), pork and spare ribs from June $8^{\text {th }}$, 2010 to August 24 ${ }^{\text {th }}$, 2010.

| Date | Corn <br> (pig feed) <br> (RMB/kg) | Pork (RMB/kg) | Spare ribs (RMB/kg) | Date | Corn (pig feed) (RMB/kg) | Pork (RMB/kg) | Spare ribs (RMB/kg) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Jun-08 | 1.80 | N/A | N/A | Jul-20 | 2.10 | N/A | N/A |
| Jun-11 | 1.60 | N/A | N/A | Jul-21 | N/A | 13.60 | N/A |
| Jun-13 | 1.70 | N/A | N/A | Jul-24 | N/A | N/A | 18.12 |
| Jun-14 | N/A | N/A | 15.62 | Jul-25 | N/A | 13.00 | N/A |
| Jun-15 | 2.00 | N/A | N/A | Jul-29 | 2.16 | N/A | 18.26 |
| Jun-18 | 2.10 | N/A | N/A | Jul-30 | N/A | 12.40 | N/A |
| Jun-19 | N/A | N/A | 15.76 | Aug-02 | N/A | 13.20 | N/A |
| Jun-21 | 2.08 | N/A | N/A | Aug-03 | 2.16 | N/A | N/A |
| Jun-23 | N/A | 9.80 | N/A | Aug-06 | N/A | 12.80 | N/A |
| Jun-24 | 2.08 | N/A | 15.76 | Aug-08 | 2.00 | N/A | N/A |
| Jun-25 | N/A | 10.80 | N/A | Aug-09 | N/A | 12.80 | N/A |
| Jun-27 | 2.10 | N/A | N/A | Aug-11 | 2.16 | N/A | N/A |
| Jun-28 | N/A | 10.40 | N/A | Aug-12 | N/A | 13.00 | N/A |
| Jun-29 | 2.10 | N/A | 16.00 | Aug-14 | 2.15 | N/A | 19.62 |
| Jul-03 | 1.98 | 10.50 | N/A | Aug-15 | N/A | 12.70 | N/A |
| Jul-04 | N/A | N/A | 16.38 | Aug-17 | 2.15 | N/A | N/A |
| Jul-07 | 2.10 | N/A | N/A | Aug-18 | N/A | 13.20 | N/A |
| Jul-09 | N/A | 10.60 | 17.26 | Aug-19 | N/A | N/A | 19.38 |
| Jul-11 | 2.10 | N/A | N/A | Aug-22 | 2.00 | N/A | N/A |
| Jul-14 | N/A | 11.50 | 17.62 | Aug-23 | N/A | 13.00 | N/A |
| Jul-16 | N/A | 11.80 | N/A | Aug-24 | N/A | N/A | 20.50 |
| Jul-19 | N/A | N/A | 17.62 |  |  |  |  |

The data in Table (4.1) can be presented by the graph below:

(Figure 4.2)
Let June $8^{\text {th }}$ be the time $t=0$. We then try to find the fitting function.
Considering that during this period of time, the prices are monotone increasing, we may only analyze the part of function when $t<T$.
Therefore,

$$
P_{a}=A_{a}\left(P_{0}+\left(P^{\prime}-P_{0}\right)\left(1-\frac{\operatorname{Gamma}\left[n_{a}-1, k_{a} t\right]}{\operatorname{Gamma}\left[n_{a}-1\right]}\right)\right)
$$

Adjusting the parameters, we have

$$
P_{0} \rightarrow 1.6, P^{\prime} \rightarrow 2.1, A_{1} \rightarrow 1, n_{1} \rightarrow 10, k_{1} \rightarrow 1.5
$$

That is,

$$
P_{1}=1.6+(2.1-1.6)\left(1-\frac{\operatorname{Gamma}[10-1,1.5 t]}{\operatorname{Gamma}[10-1]}\right)
$$

Using computer to plot the function, we have

Substituting $P_{0} \rightarrow 1.6, P^{\prime} \rightarrow 2.1, A_{2}=\frac{10}{1.6}=6.25$ into the equation of $P_{2}$, we have

$$
P_{0} \rightarrow 1.6, P^{\prime} \rightarrow 2.1, A_{2} \rightarrow 6.25, n_{2} \rightarrow 15, k_{2} \rightarrow 0.4
$$

That is,

$$
P_{2}=6.25\left(1.6+(2.1-1.6)\left(1-\frac{\operatorname{Gamma}[15-1,0.4 t]}{\operatorname{Gamma}[15-1]}\right)\right)
$$

The expression of $P_{2}$ can be graphed as Figure (4.4):

Substituting $P_{0} \rightarrow 1.6, P^{\prime} \rightarrow 2.1, A_{3}=\frac{15.7}{1.6}=9.81$ into the equation of $P_{3}$, similarly, we have

$$
P_{0} \rightarrow 1.6, P^{\prime} \rightarrow 2.1, A_{3} \rightarrow 9.81, n_{3} \rightarrow 6, k_{3} \rightarrow 0.1
$$

Hence,

$$
P_{3}=9.81\left(1.6+(2.1-1.6)\left(1-\frac{\operatorname{Gamma}[6-1,0.1 t]}{\operatorname{Gamma}[6-1]}\right)\right)
$$

(Figure 4.5)

Combining the three graphs, we have

(Figure 4.6)

### 4.4 Conclusion

From the graph we can see that our function well fits with the price fluctuation in real life. With the help of the price model, we can analyze the price change of a certain product, and then to anticipate the fluctuation that may appear in the downstream prices. The influences that price fluctuation may bring to an economy are significant. Using the model of Velocity Transmission in a Queue will be of great value for the producers' management. Meanwhile, policy-makers can take it as a reference when trying to exert macro adjustment policies. Consumers may also refer to it for help when making their shopping choices.

## Chapter V

## Retrospect

The study of this project has been a precious experience for us. On the one hand, the study has greatly improved our capacity of mathematical thinking. We have learned how to build up the model on the basis of a practical problem, and more importantly, to use the model in real life. In the process, we used many practical methods to solve the challenges we are faced with. When trying to cope with transcendental equations, for instance, we substituted real statistics into the equation. Also, we have used graphic tools to plot the functions to deal with the data, which has greatly helped with the analysis. We believe that these methods will play a significant role in our future math study as well as in our life.

On the other hand, we have had the opportunity to learn some advanced mathematical knowledge. From our research about Gamma Function, to the solution of transcendental equations, to the use of graphic tools, we have gained a better understanding of the true meaning of mathematics that it is of not only pure beauty, but also practical value. We have come to realize that in an era when progress is being made in every single field, mathematics has never been more connected to our life as it is now. We appreciate the opportunity it offers us with: Equipped with knowledge, shouldered with moral responsibilities, we can make full use of mathematics to serve our community.

Meanwhile, our project does call for further improvement. Firstly, we have simplified the queue as a straight line, which is unlikely in real cases. Secondly, when we are studying the transmission of price fluctuation in an industrial chain, we have neglected the influence of other factors, such as the financial policies and the supply-demand relationship. Partly due to this, our function is still slightly deviated from the real figures.

In the future, we want to keep perfecting this model. For instance, we are considering introducing another variable to indicate the effect caused by other factors. We can also take the differences between the maximum velocities of people into consideration. We believe that the model can be further improved in this way.

At the very end of this report, we want to express our gratitude to our mentors at Hangzhou Foreign Languages School. This report will not be the destination of our study. In the future, our joint efforts will still be a great encouragement to our further study on this project, which we are all looking forward to.
