# A SIMPLE PROOF OF WITTEN CONJECTURE THROUGH LOCALIZATION 

YON-SEO KIM AND KEFENG LIU<br>Department of Mathematics, UCLA; Center of Math Sciences, Zhejiang University

#### Abstract

We obtain a system of relations between Hodge integrals with one $\lambda$-class. As an application, we show that its first non-trivial relation implies the Witten's Conjecture/Kontsevich Theorem [13, 7].

## 1. Introduction

In this paper, we obtain an alternate proof of the Witten's Conjecture [13] which claims that the tautological intersections on the moduli space of stable curves $\overline{\mathcal{M}}_{g, n}$ is governed by KdV hierarchy. It is first proved by M.Kontsevich [7 by constructing combinatorial model for the intersection theory of $\overline{\mathcal{M}}_{g, n}$ and interpreting the trivalent graph summation by a Feynman diagram expansion for a new matrix integral. A.Okounkov-R.Pandharipande [12] and M.Mirzakhani [11] gave different approaches through the enumeration of branched coverings of $\mathbb{P}^{1}$ and the Weil-Petersen volume, respectively. Recently, M.Kazarian-S.Lando [5] obtained an algebro-geometric proof by using the ELSV-formula to relate the intersection indices of $\psi$-classes to Hurwitz numbers.

Here we take an approach using virtual functorial localization on the moduli space of relative stable morphisms $\overline{\mathcal{M}}_{g}\left(\mathbb{P}^{1}, \mu\right)[9] . \overline{\mathcal{M}}_{g}\left(\mathbb{P}^{1}, \mu\right)$ consists of maps from Riemann surfaces of genus $g$ and $n=l(\mu)$ marked points to $\mathbb{P}^{1}$ which has prescribed ramification type $\mu$ at $\infty \in \mathbb{P}^{1}$. As the result, we obtain a system of relations between linear Hodge integrals. It recursively expresses each linear Hodge integral by lower-dimensional ones. The first non-trivial relation of this system is 'cut-and-join relation', and is of same recursion type as that of single Hurwitz numbers [8. Moreover, as we increase the ramification degree, we can extract a relation between absolute Gromov-Witten invariants from this relation. And we show this relation implies the following recursion relation for the correlation functions of topological gravity [1]:

$$
\begin{align*}
\left\langle\tilde{\sigma}_{n} \prod_{k \in S} \tilde{\sigma}_{k}\right\rangle_{g}= & \sum_{k \in S}(2 k+1)\left\langle\tilde{\sigma}_{n+k-1} \prod_{l \neq k} \tilde{\sigma}_{l}\right\rangle_{g}+\frac{1}{2} \sum_{a+b=n-2}\left\langle\tilde{\sigma}_{a} \tilde{\sigma}_{b} \prod_{l \in S} \tilde{\sigma}_{l}\right\rangle_{g-1} \\
& +\frac{1}{2} \sum_{S=X \cup Y, a+b=n-2, g_{1}+g_{2}=g}\left\langle\tilde{\sigma}_{a} \prod_{k \in X} \tilde{\sigma}_{k}\right\rangle_{g_{1}}\left\langle\tilde{\sigma}_{b} \prod_{l \in Y} \tilde{\sigma}_{l}\right\rangle_{g_{2}} \tag{*}
\end{align*}
$$

which is equivalent to the Witten's Conjecture/Kontsevich Theorem. This recursion relation $\left(^{*}\right)$ is also equivalent to the Virasoro constraints; i.e. $\left(^{*}\right)$ can be expressed as linear, homogeneous differential equations for the $\tau$-function [1]

$$
\begin{gathered}
\tau(\tilde{t})=\exp \sum_{g=0}^{\infty}\left\langle\exp \sum_{n} \tilde{t}_{n} \tilde{\sigma}_{n}\right\rangle_{g} \\
L_{n} \cdot \tau=0, \quad(n \geq-1)
\end{gathered}
$$

where $L_{n}$ denote the differential operators

$$
\begin{aligned}
L_{-1} & =-\frac{1}{2} \frac{\partial}{\partial \tilde{t}_{0}}+\sum_{k=1}^{\infty}\left(k+\frac{1}{2}\right) \tilde{t}_{k} \frac{\partial}{\partial \tilde{t}_{k-1}}+\frac{1}{4} \tilde{t}_{0}^{2} \\
L_{0} & =-\frac{1}{2} \frac{\partial}{\partial \tilde{t}_{1}}+\sum_{k=0}^{\infty}\left(k+\frac{1}{2}\right) \tilde{t}_{k} \frac{\partial}{\partial \tilde{t}_{k}}+\frac{1}{16} \\
L_{n} & =-\frac{1}{2} \frac{\partial}{\partial \tilde{t}_{n-1}}+\sum_{k=0}^{\infty}\left(k+\frac{1}{2}\right) \tilde{t}_{k} \frac{\partial}{\partial \tilde{t}_{k+n}}+\frac{1}{4} \sum_{i=1}^{n} \frac{\partial^{2}}{\partial \tilde{t}_{i-1} \partial \tilde{t}_{n-i}}
\end{aligned}
$$

As a remark, it is possible that the general recursion relation obtained from our approach implies the Virasoro conjecture for a general non-singular projective variety.

The rest of this paper is organized as follows: In section 2, we recall the recursion formula obtained in [6] and derive cut-and-join relation as its special case. In section 3, we prove asymptotic formulas for the coefficients in the cut-and-join relation. Then we derive first two relations of the system of relations between linear Hodge integrals, and show that the cut-and-join relation implies $\left({ }^{*}\right)$.

* Please refer to [6 for miscellaneous notations.

## 2. Recursion Formula

The following recursion formula was derived in [6].
Theorem 2.1. For any partition $\mu$ and e with $|e|<|\mu|+l(\mu)-\chi$, we have

$$
\begin{equation*}
\left[\lambda^{l(\mu)-\chi}\right] \sum_{|\nu|=|\mu|} \Phi_{\mu, \nu}^{\bullet}(-\lambda) z_{\nu} \mathcal{D}_{\nu, e}^{\bullet}(\lambda)=0 \tag{1}
\end{equation*}
$$

where the sum is taken over all partitions $\nu$ of the same size as $\mu$.
Here $\left[\lambda^{a}\right]$ means taking the coefficient of $\lambda^{a}$, and $\mathcal{D}_{\nu, e}^{\bullet}$ consists of linear Hodge integrals as follows;

$$
\mathcal{D}_{g, \nu, e}=\frac{1}{l(e)!\mid \text { Aut } \nu \mid}\left[\prod_{i=1}^{l(\nu)} \frac{\nu_{i}^{\nu_{i}}}{\nu_{i}!}\right] \int_{\overline{\mathcal{M}}_{g, l(\nu)+l(e)}} \frac{\Lambda_{g}^{\vee}(1) \prod_{j=1}^{l(e)}\left(1-\psi_{j}\right)^{e_{j}}}{\prod_{i=1}^{l(\nu)}\left(1-\nu_{i} \psi_{i}\right)}
$$

where $\Lambda_{g}^{\vee}(t)$ is the dual Hodge bundle;

$$
\Lambda_{g}^{\vee}(t)=t^{g}-\lambda_{1} t^{g-1}+\cdots+(-1)^{g} \lambda_{g}
$$

Introduce formal variable $p_{i}, q_{j}$ such that $p_{\nu}=p_{\nu_{1}} \times \cdots \times p_{\nu_{l(\nu)}}, q_{e}=q_{e_{1}} \times \cdots \times q_{e_{l(e)}}$ , and form a generating series to define $\mathcal{D}_{\nu, e}^{\bullet}$ as follows:

$$
\begin{aligned}
\mathcal{D}(\lambda, p, q) & =\sum_{|\nu| \geq 1} \sum_{g \geq 0} \lambda^{2 g-2+l(\nu)} p_{\nu} q_{e} \mathcal{D}_{g, \nu} \\
\mathcal{D}^{\bullet}(\lambda, p, q) & =\exp (\mathcal{D}(\lambda, p, q))=: \sum_{|\nu| \geq 0} \lambda^{-\chi+l(\nu)} p_{\nu} q_{e} \mathcal{D}_{\chi, \nu, e}^{\bullet}=\sum_{|\nu| \geq 0} p_{\nu, e} q_{e} \mathcal{D}_{\nu, e}^{\bullet}(\lambda)
\end{aligned}
$$

The convoluted term $\Phi_{\mu, \nu}^{\bullet}(-\lambda)$ consists of double Hurwitz numbers as follows:

$$
\Phi_{\nu, \mu}^{\bullet}(\lambda)=\sum_{\chi} H_{\chi}^{\bullet}(\nu, \mu) \frac{\lambda^{-\chi+l(\nu)+l(\mu)}}{(-\chi+l(\nu)+l(\mu))!} \quad \Phi^{\bullet}\left(\lambda ; p^{0}, p^{\infty}\right)=1+\sum_{\nu, \mu} \Phi_{\nu, \mu}^{\bullet}(\lambda) p_{\nu}^{0} p_{\mu}^{\infty}
$$

Here $H_{\chi}^{\bullet}(\nu, \mu)$ is the double Hurwitz number with ramification type $\nu, \mu$ with Euler characteristic $\chi$. The recursion formula (11) was derived by integrating point-classes over the relative moduli space $\overline{\mathcal{M}}_{g}\left(\mathbb{P}^{1}, \mu\right)$, and the 'cut-and-join relation' is only the first term in this much more general formula. This can also be seen as follows: Denote by $J_{i j}(\mu), C_{i}(\mu)$ for the cut-and-join partitions of $\mu$ [14] and consider the following identity obtained by localization method:

$$
\begin{array}{r}
0=\int_{\overline{\mathcal{M}}_{g}\left(\mathbb{P}^{1}, \mu\right)} \operatorname{Br}^{*} \prod_{k=0}^{r-2}(H-k)=\text { Contribution from the graph that is mapped to } p_{r} \\
\quad+\text { Contribution from the graphs that are mapped to } p_{r-1}
\end{array}
$$

It is straightforward to show that preimages of $p_{r}$ and $p_{r-1}$ under the branching morphism $\operatorname{Br}: \overline{\mathcal{M}}_{g}\left(\mathbb{P}^{1}, \mu\right) \longrightarrow \mathbb{P}^{r}$ are the unique graph $\Gamma_{r}$ and the 'cut-and-join graphs' of $\Gamma_{r}$, respectively. Hence we recover the 'cut-and-join relation' as the restriction of (11) to the first two fixed points $\left\{p_{r}, p_{r-1}\right\}$;

$$
\begin{equation*}
r \Gamma_{r}=\sum_{i=1}^{n}\left[\sum_{j \neq i} \frac{\mu_{i}+\mu_{j}}{1+\delta_{\mu_{j}}^{\mu_{i}}} \Gamma_{J}^{i j}+\sum_{p=1}^{\mu_{i}-1} \frac{p\left(\mu_{i}-p\right)}{1+\delta_{\mu_{i}-p}^{p}}\left(\Gamma_{C 1}^{i, p}+\sum_{g_{1}+g_{2}=g, \nu_{1} \cup \nu_{2}=\nu} \Gamma_{C 2}^{i, p}\right)\right] \tag{2}
\end{equation*}
$$

where $\Gamma$ 's are the contributions from 'cut-and-join' graphs defined as follows;

- Original graph that is mapped to the branching point $p_{r}$

$$
\Gamma_{r}=\frac{1}{\mid \text { Aut } \mu \mid} \prod_{i=1}^{n} \frac{\mu_{i}^{\mu_{i}}}{\mu_{i}!} \int_{\overline{\mathcal{M}}_{g, n}} \frac{\Lambda_{g}^{\vee}(1)}{\prod\left(1-\mu_{i} \psi_{i}\right)}
$$

- Join graph that is obtained by joining $i$-th and $j$-th marked points:

$$
\Gamma_{J}^{i j}=\frac{1}{\mid \text { Aut } \eta \mid} \prod_{k=1}^{n-1} \frac{\eta_{k}^{\eta_{k}}}{\eta_{k}!} \int_{\overline{\mathcal{M}}_{g, n-1}} \frac{\Lambda_{g}^{\vee}(1)}{\prod\left(1-\eta_{k} \psi_{k}\right)}, \quad \eta \in J_{i j}(\mu)
$$

- Cut graph that is obtained by pinching around the $i$-th marked point:

$$
\Gamma_{C 1}^{i}=\frac{1}{\mid \text { Aut } \nu \mid} \prod_{k=1}^{n+1} \frac{\nu_{k}^{\nu_{k}}}{\nu_{k}!} \int_{\overline{\mathcal{M}}_{g-1, n+1}} \frac{\Lambda_{g-1}^{\vee}(1)}{\prod\left(1-\nu_{k} \psi_{k}\right)}, \quad \nu \in C_{i}(\mu)
$$

- Cut graph that is obtained by splitting around the $i$-th marked point:

$$
\Gamma_{C 2}^{i}=\left[\prod_{k=1}^{n+1} \frac{\nu_{k}^{\nu_{k}}}{\nu_{k}!}\right] \prod_{s=1,2} \frac{1}{\mid \text { Aut } \nu_{s} \mid} \int_{\overline{\mathcal{M}}_{g_{s}, n_{s}}} \frac{\Lambda_{g_{s}}^{\vee}(1)}{\prod\left(1-\nu_{s, k} \psi_{k}\right)}, \quad \nu \in C_{i}(\mu)
$$

As was mentioned in [10, this 'cut-and-join relation' (21) recovers the ELSV formula [2] since this relation is of the same type as the recursion formula for single Hurwitz numbers [8], hence giving the identification of the graph contributions with single Hurwitz numbers:

$$
H_{g, \mu}=\frac{r!}{\mid \text { Aut } \mu \mid}\left[\prod_{i=1}^{l(\mu)} \frac{\mu_{i}^{\mu_{i}}}{\mu_{i}!}\right] \int_{\overline{\mathcal{M}}_{g, l(\mu)}} \frac{\Lambda_{g}(1)}{\prod_{i=1}^{l(\mu)}\left(1-\mu_{i} \psi_{i}\right)}
$$

which is the ELSV formula. When there's no confusion, we will denote by $\eta=\eta^{i j}$ for the join-partition and $\nu=\nu^{i, p}$ for the cut-partition of splitting $\mu_{i}=p+\left(\mu_{i}-p\right)$ for some $1 \leq p<\mu_{i}$. Also denote by $\nu_{1}$ and $\nu_{2}$ for the splitting of cut-partition $\nu$ such that $\nu_{1} \cup \nu_{2}=\nu$ with $p \in \nu_{1}, \mu_{i}-p \in \nu_{2}$. Note that in the $\Gamma_{C 2}$-type contribution, unstable vertices (i.e. $g=0$ and $n=1,2$ ) are included. We can also use any set $\left\{p_{k_{0}}, \cdots, p_{k_{n}}\right\}$, $n>0$ of fixed points and obtain relations between linear Hodge integrals. And these can be applied to derive deeper relations.

## 3. Degree Analysis

In this section, we study asymptotic behaviour of the 'cut-and-join relation' and obtain a system of relations between linear Hodge integrals. The Hodge integral terms in the graph contributions can be expanded as follows:

$$
\begin{equation*}
\int_{\overline{\mathcal{M}}_{g, n}} \frac{\Lambda_{g}^{\vee}(1)}{\prod\left(1-\mu_{i} \psi_{i}\right)}=\sum_{k} \prod \mu_{i}^{k_{i}} \int_{\overline{\mathcal{M}}_{g, n}} \prod \psi_{i}^{k_{i}}+\text { lower degree terms } \tag{3}
\end{equation*}
$$

where $\tilde{k}=\left(k_{1}, \cdots, k_{n}\right)$ are multi-indices running over condition $\sum k_{i}=3 g-3+n$. Hence the top-degree terms consist of Hodge-integral of $\psi$-classes and lower degree terms involve $\lambda$-classes. This will give a system of relations between Hodge integrals involving one $\lambda$-class. More precisely, integrals will be determined recursively by either lower-dimensional or lower-degree $\lambda$-class integrals. The following asymptotic formula is crucial in degree analysis.

Proposition 3.1. As $n \longrightarrow \infty$, we have for $k, l \geq 0$

$$
\begin{array}{ll}
e^{-n} \sum_{p+q=n} \frac{p^{p+k+1} q^{q+l+1}}{p!q!} & \longrightarrow \frac{1}{2}\left[\frac{(2 k+1)!!(2 l+1)!!}{2^{k+l+2}(k+l+2)!}\right] n^{k+l+2}+o\left(n^{k+l+2}\right) \\
e^{-n} \sum_{p+q=n} \frac{p^{p+k+1} q^{q-1}}{p!q!} & \longrightarrow \frac{n^{k+\frac{1}{2}}}{\sqrt{2 \pi}}-\left[\frac{(2 k+1)!!}{2^{k+1} k!}\right] n^{k}+o\left(n^{k}\right)
\end{array}
$$

Proof. Let $m$ be an integer such that $1<m<n$ and consider three ranges of $p, q$ as follows:

$$
\begin{aligned}
& R_{l}=\{(p, q) \mid p>n-m \text { and } q<m\} \\
& R_{c}=\{(p, q) \mid m \leq p, q \leq n-m\} \\
& R_{r}=\{(p, q) \mid p<m \text { and } q>n-m\}
\end{aligned}
$$

Recall the Stirling's formula;

$$
n!=\frac{\sqrt{2 \pi} n^{n+1 / 2}}{e^{n}}\left(1+\frac{1}{12 n}+\cdots\right)
$$

For the summation over $R_{c}$, let $m=n \epsilon$ and $p=n x$ for some $\epsilon, x \in \mathbb{R}_{>0}$ so that $m, p \in \mathbb{N}$, then we have

$$
\begin{aligned}
& e^{-n} \sum_{p=m}^{n-m} \frac{p^{p+k+1}}{p!} \frac{q^{q+l+1}}{q!}=\sum_{p=m}^{n-m} \frac{1}{2 \pi} p^{k+\frac{1}{2}} q^{l+\frac{1}{2}}[1+o(1)] \\
&=\frac{n^{k+l+2}}{2 \pi} \sum_{p=m}^{n-m} x^{k+\frac{1}{2}}(1-x)^{l+\frac{1}{2}} \frac{1}{n}+o\left(n^{k+l+2}\right) \\
& \longrightarrow \frac{n^{k+l+2}}{2 \pi} \int_{\epsilon}^{1-\epsilon} x^{k+\frac{1}{2}}(1-x)^{l+\frac{1}{2}} d x+o\left(n^{k+l+2}\right) \quad \text { as } n \text { goes to } \infty \\
&=\frac{n^{k+l+2}}{2 \pi} \frac{(2 k+1)!!(2 l+1)!!}{(2(k+l)+3)!!} \int_{\epsilon}^{1-\epsilon} \frac{(1-x)^{k+l+\frac{3}{2}}}{\sqrt{x}} d x+o\left(n^{k+l+2}\right)+O(\sqrt{\epsilon}) \\
&=\frac{1}{2}\left[\frac{(2 k+1)!(2 l+1)!!}{2^{k+l+2}(k+l+2)!}\right] n^{k+l+2}+o\left(n^{k+l+2}\right)+O(\sqrt{\epsilon})
\end{aligned}
$$

As $n \longrightarrow \infty$, we can send $\epsilon \longrightarrow 0$. For the summation over $R_{l}$ and $R_{r}$, the top-degree terms belong to $O\left(n^{k+1 / 2}\right)$ and $O\left(n^{l+1 / 2}\right)$, respectively. Since we assume $k, l \geq 0$, both cases belong to $o\left(n^{k+l+2}\right)$, and this proves the first formula. For the second formula, $R_{l}$ has highest order of $n^{k+1 / 2}$ and one can show that the leading term in the asymptotic behaviour is $n^{k+1 / 2} / \sqrt{2 \pi}$. After integration by parts, $R_{c}$ gives the second highest term in the asymptotic behaviour

$$
\begin{gathered}
e^{-n} \sum_{p=m}^{n-1} \frac{p^{p+k+1}}{p!} \frac{q^{q-1}}{q!}=\sum_{p=m}^{n-1} \frac{1}{2 \pi} p^{k+\frac{1}{2}} q^{l-\frac{3}{2}}[1+o(1)]=\frac{n^{k}}{2 \pi} \sum_{p=m}^{n-1} x^{k+\frac{1}{2}}(1-x)^{-3 / 2} \frac{1}{n}+o\left(n^{k}\right) \\
\quad \longrightarrow \frac{n^{k}}{2 \pi} \int_{\epsilon}^{1} x^{k+\frac{1}{2}}(1-x)^{-3 / 2} d x+o\left(n^{k}\right) \quad \text { as } n \text { goes to } \infty \\
=\frac{n^{k+1 / 2}}{\sqrt{2 \pi}}-\frac{n^{k}}{2 \pi}(2 k+1) \int_{\epsilon}^{\delta} \frac{x^{k-\frac{1}{2}}}{\sqrt{1-x}} d x+o\left(n^{k}\right) \\
=\frac{n^{k+1 / 2}}{\sqrt{2 \pi}}-\left[\frac{(2 k+1)!!}{2^{k+1} k!}\right] n^{k}+o\left(n^{k}\right)+O(\sqrt{\epsilon})
\end{gathered}
$$

This proves the second formula.

Let $\mu_{i}=N x_{i}$ for some $x_{i} \in \mathbb{R}$ and $N \in \mathbb{N}$. By taking general values of $x_{i}$, we can assume, without loss of generality, that $\mid$ Aut $\mu \mid=1$. As the ramification degree tends to infinity, i.e. as $N \longrightarrow \infty$, the Hodge integral expansion (3) tends to

$$
\prod_{i=1}^{n} \frac{\mu_{i}^{\mu_{i}+k_{i}}}{\mu_{i}!} \int_{\overline{\mathcal{M}}_{g, n}} \prod \psi_{i}^{k_{i}}+O\left(e^{N} N^{m-1}\right) \longrightarrow e^{|\mu|} \prod_{i=1}^{n} \frac{\mu_{i}^{k_{i}-1 / 2}}{\sqrt{2 \pi}} \int_{\overline{\mathcal{M}}_{g, n}} \prod \psi_{i}^{k_{i}}+O\left(e^{N} N^{m-1}\right)
$$

where $m=3 g-3+n-(n / 2)$ is the highest degree of $N$ in (31). Same expansion applies to each term in (2). By taking out the common factor $e^{|\mu|}$ and applying the asymptotic formula (3.1), we find that

$$
\begin{aligned}
r \Gamma_{r} & =N^{m+1}\left[\left(x_{1}+\cdots+x_{n}\right) \prod_{i=1}^{n} \frac{x_{i}^{k_{i}-1 / 2}}{\sqrt{2 \pi}} \int_{\overline{\mathcal{M}}_{g, n}} \prod_{i=1}^{n} \psi_{i}^{k_{i}}\right]+O\left(N^{m}\right) \\
\Gamma_{C 1}^{i} & =\frac{N^{m+1 / 2}}{2} \sum_{k+l=k_{i}-2} \frac{(2 k+1)!!(2 l+1)!!}{2^{k+l+2}(k+l+2)!} x_{i}^{k+l+2} \prod_{j \neq i} \frac{x_{j}^{k_{j}-1 / 2}}{\sqrt{2 \pi}}\left[\int_{\overline{\mathcal{M}}_{g-1, n+1}} \psi_{1}^{k} \psi_{2}^{l} \prod_{j \neq i} \psi_{j}^{k_{j}}\right. \\
& \left.+\sum_{g_{1}+g_{2}=g, \nu_{1} \cup \nu_{2}=\nu} \int_{\overline{\mathcal{M}}_{g_{1}, n_{1}}} \psi_{1}^{k} \prod \psi_{j}^{k_{j}} \int_{\overline{\mathcal{M}}_{g_{2}, n_{2}}} \psi_{1}^{l} \prod \psi_{j}^{k_{j}}\right]+O\left(N^{m}\right) \\
\Gamma_{C 2}^{i} & =N^{m+1 / 2} \prod_{j \neq i} \frac{x_{j}^{k_{j}-1 / 2}}{\sqrt{2 \pi}}\left[\sqrt{N} \frac{x_{i}^{k_{i}+1 / 2}}{\sqrt{2 \pi}} \int_{\overline{\mathcal{M}}_{g, n}} \prod_{l=1}^{n} \psi_{l}^{k_{l}}-\frac{\left(2 k_{i}+1\right)!!}{2^{k_{i}+1} k_{i}!} x_{i}^{k_{i}} \int_{\overline{\mathcal{M}}_{g, n}} \prod_{l=1}^{n} \psi_{l}^{k_{l}}\right]+O\left(N^{m}\right) \\
\Gamma_{J}^{i j} & =N^{m+1 / 2} \frac{\left(x_{i}+x_{j}\right)^{k_{i}+k_{j}-1 / 2}}{\sqrt{2 \pi}} \prod_{l \neq i, j} \frac{x_{l}^{k_{l}-1 / 2}}{\sqrt{2 \pi}} \int_{\overline{\mathcal{M}}_{g, n-1}} \psi^{k_{i}+k_{j}-1} \prod_{l \neq i, j} \psi_{l}^{k_{l}}+O\left(N^{m}\right)
\end{aligned}
$$

Putting them together in the 'cut-and-join relation' (2) yields a system of relations between Hodge integrals with one $\lambda$-class as follows: First, we have a system of relations given by the spectrum of $N$-degree. Secondly, each relation given by some fixed $N$-degree stratum can be viewed as a polynomial in $x_{i}$ 's;

$$
R_{\tilde{m}}\left(x_{1}, \cdots, x_{n}\right)=\sum_{\left(s_{1}, \cdots, s_{n}\right)} C\left(s_{1}, \cdots, s_{n}\right) x_{1}^{s_{1}} \cdots x_{n}^{s_{n}}
$$

where $\tilde{m}$ is a half integer less than or equal to $m+1$ and the coefficient $C\left(s_{i}\right)$ of the homogeneous polynomial $x_{1}^{s_{1}} \cdots x_{n}^{s_{n}}$ involves linear Hodge integrals. Since $x_{i}$ 's are independent variables, we obtain vanishing relations for each of $C\left(s_{i}\right)$ 's. In particular, the first few vanishing relations are given as follows:

- For $N^{m+1}$-stratum, we have a trivial identity:

$$
\left(x_{1}+\cdots+x_{n}\right) \prod \frac{x_{i}^{k_{i}-1 / 2}}{\sqrt{2 \pi}} \int_{\overline{\mathcal{M}}_{g, n}} \prod \psi_{i}^{k_{i}}-\left(x_{1}+\cdots+x_{n}\right) \prod \frac{x_{i}^{k_{i}-1 / 2}}{\sqrt{2 \pi}} \int_{\overline{\mathcal{M}}_{g, n}} \prod \psi_{i}^{k_{i}}=0
$$

- From $N^{m+1 / 2}$-stratum, we obtain a relation between cut-and-join graphs:

$$
\begin{aligned}
& \sum_{i=1}^{n}\left[\frac{\left(2 k_{i}+1\right)!!}{2^{k_{i}+1} k_{i}!} x_{i}^{k_{i}} \prod_{j \neq i} \frac{x_{j}^{k_{j}-1 / 2}}{\sqrt{2 \pi}} \int_{\overline{\mathcal{M}}_{g, n}} \prod \psi_{j}^{k_{j}}\right. \\
& -\sum_{j \neq i} \frac{\left(x_{i}+x_{j}\right)^{k_{i}+k_{j}-1 / 2}}{\sqrt{2 \pi}} \prod_{l \neq i, j} \frac{x_{l}^{k_{l}-1 / 2}}{\sqrt{2 \pi}} \int_{\overline{\mathcal{M}}_{g, n-1}} \psi^{k_{i}+k_{j}-1} \prod \psi_{l}^{k_{l}} \\
& -\frac{1}{2} \sum_{k+l=k_{i}-2} \frac{(2 k+1)!!(2 l+1)!!}{2^{k+l+2}(k+l+2)!} x_{i}^{k_{i}} \prod_{j \neq i} \frac{x_{j}^{k_{j}-1 / 2}}{\sqrt{2 \pi}}\left[\int_{\overline{\mathcal{M}}_{g-1, n+1}} \psi_{1}^{k} \psi_{2}^{l} \prod \psi_{j}^{k_{j}}\right. \\
& \left.\left.+\sum_{g_{1}+g_{2}=g, \nu_{1} \cup \nu_{2}=\nu} \int_{\overline{\mathcal{M}}_{g_{1}, n_{1}}} \psi_{1}^{k} \prod \psi_{j}^{k_{j}} \int_{\overline{\mathcal{M}}_{g_{2}, n_{2}}} \psi_{1}^{l} \prod \psi_{j}^{k_{j}}\right]\right]=0 \quad \cdots(* *)
\end{aligned}
$$

- Lower degree strata will give relations for Hodge integrals involving non-trivial $\lambda$-class in terms of lower-dimensional ones. For example, the relation given by the $N^{m}$-stratum recovers the $\lambda_{1}$-expression.
And the first non-trivial relation $\left(^{* *}\right)$ implies the Witten's Conjecture ( ${ }^{*}$ ):
Theorem 1. The relation (**) implies (*).
Proof. Introduce formal variables $s_{i} \in \mathbb{R}_{>0}$ and recall the Laplace Transformation:

$$
\int_{0}^{\infty} \frac{x^{k-1 / 2}}{\sqrt{2 \pi}} e^{-x / 2 s} d x=(2 k-1)!!s^{k+1 / 2}, \quad \int_{0}^{\infty} x^{k} e^{-x / 2 s} d x=k!(2 s)^{k+1}
$$

Applying Laplace Transformation to the $N^{m+1 / 2}$-stratum gives the following relation:

$$
\begin{aligned}
& \sum_{i=1}^{n} {[ } \\
& \quad s_{i}^{k_{i}+1}\left(2 k_{i}+1\right)!!\prod_{j \neq i} s_{j}^{k_{j}+1 / 2}\left(2 k_{j}-1\right)!!\int_{\overline{\mathcal{M}}_{g, n}} \prod \psi_{l}^{k_{l}} \\
&-\sum_{a+b=k_{i}-2} s_{i}^{k_{i}+1}(2 a+1)!!(2 b+1)!!\prod_{j \neq i} s_{j}^{k_{j}+1 / 2}\left(2 k_{j}-1\right)!! \\
& \times\left(\int_{\overline{\mathcal{M}}_{g-1, n+1}} \psi_{1}^{a} \psi_{2}^{b} \prod \psi_{l}^{k_{l}}+\sum_{g_{1}+g_{2}=g, \cdots} \int_{\overline{\mathcal{M}}_{g_{1}, n_{1}}} \psi^{a} \prod \psi_{l}^{k_{l}} \int_{\overline{\mathcal{M}}_{g_{2}, n_{2}}} \psi^{b} \prod \psi_{l}^{k_{l}}\right) \\
&-\sum_{j \neq i} \frac{(2 w+1)!!}{\sqrt{s_{i}}+\sqrt{s_{j}}}\left(s_{i} s_{j}^{w+2}+s_{i}^{3 / 2} s_{j}^{w+3 / 2}+\cdots+s_{i}^{w+2} s_{j}\right) \\
&\left.\times \prod_{l \neq i, j} s_{l}^{k_{l}+1 / 2}\left(2 k_{l}-1\right)!!\int_{\overline{\mathcal{M}}_{g, n-1}} \psi^{w} \prod \psi_{l}^{k_{l}}\right]=0
\end{aligned}
$$

where $w=k_{i}+k_{j}-1$. The last term is derived from direct integration;

$$
\begin{aligned}
& \frac{N^{k+\frac{1}{2}}}{\sqrt{2 \pi}} \int_{0}^{\infty} \int_{0}^{\infty}\left(x_{i}+x_{j}\right)^{k+\frac{1}{2}} e^{-x_{i} y_{i}} e^{-x_{j} y_{j}} d x_{i} d x_{j}=\frac{N^{k+\frac{1}{2}}}{2 \sqrt{2 \pi}} \int_{0}^{\infty} \int_{-r}^{r} r^{k+\frac{1}{2}} e^{-\frac{r+s}{2} y_{i}} e^{-\frac{r-s}{2} y_{j}} d s d r \\
& =\frac{N^{k+\frac{1}{2}}}{2 \sqrt{2 \pi}} \int_{0}^{\infty}\left[\int_{-r}^{r} e^{\frac{y_{j}-y_{i}}{2} s} d s\right] r^{k+\frac{1}{2}} e^{-\frac{y_{i}+y_{j}}{2} r} d r=\frac{N^{k+\frac{1}{2}}}{\sqrt{y_{i}}+\sqrt{y_{j}}} \frac{(2 k+1)!!}{\left(2 y_{i} y_{j}\right)^{k+\frac{3}{2}}}\left[y_{i}^{k+1}+y_{i}^{k+\frac{1}{2}} y_{j}^{\frac{1}{2}}+\cdots+y_{j}^{k+1}\right]
\end{aligned}
$$

under change of variable $r=x_{i}+x_{j}$ and $s=x_{i}-x_{j}$. Considering this as a polynomial in $s_{i}$ 's, we can isolate out coefficients to obtain

$$
\begin{aligned}
& (\#) \cdots\left(2 k_{i}+1\right)!!\prod_{j \neq i}\left(2 k_{j}-1\right)!!\int_{\overline{\mathcal{M}}_{g, n}} \prod \psi_{l}^{k_{l}}=\sum_{j \neq i}(2 w+1)!!\prod_{l \neq i, j}\left(2 k_{l}-1\right)!!\int_{\overline{\mathcal{M}}_{g, n-1}} \psi^{w} \prod_{l \neq i, j} \psi_{l}^{k_{l}}+ \\
& \sum_{a+b=k_{i}-2}(2 a+1)!!(2 b+1)!!\left[\int_{\overline{\mathcal{M}}_{g-1, n+1}} \psi^{a} \psi^{b} \prod_{l \neq i} \psi_{l}^{k_{l}}+\sum \int_{\overline{\mathcal{M}}_{g_{1}, n_{1}}} \psi^{a} \prod \psi_{l}^{k_{l}} \int_{\overline{\mathcal{M}}_{g_{2}, n_{2}}} \psi^{b} \prod \psi_{l}^{k_{l}}\right]
\end{aligned}
$$

The reason for getting 1 as coefficient in the Join-case is due to the following expansion

$$
\begin{aligned}
& \frac{1}{\sqrt{s_{i}}+\sqrt{s_{j}}}\left(s_{i} s_{j}^{w+2}+s_{i}^{3 / 2} s_{j}^{w+3 / 2}+\cdots+s_{i}^{w+2} s_{j}\right) \\
& =\frac{1}{\sqrt{s_{j}}}\left(1-\sqrt{\frac{s_{i}}{s_{j}}}+\frac{s_{i}}{s_{j}}-\left(\frac{s_{i}}{s_{j}}\right)^{3 / 2}+\cdots\right)\left(s_{i} s_{j}^{w+2}+s_{i}^{3 / 2} s_{j}^{w+3 / 2}+\cdots+s_{i}^{w+2} s_{j}\right) \\
& =\cdots+1 \cdot s_{i}^{k_{i}+1} s_{j}^{k_{j}+1 / 2}+\cdots
\end{aligned}
$$

In the notations of $(*)$, we have $\tilde{\sigma}_{n}=(2 n+1)!!\sigma_{n}=(2 n+1)!!\psi^{n}$ and

$$
\left\langle\tilde{\sigma}_{k_{1}} \cdots \tilde{\sigma}_{k_{n}}\right\rangle_{g}=\left[\prod_{i=1}^{n}\left(2 k_{i}+1\right)!!\right] \int_{\overline{\mathcal{M}}_{g, n}} \psi_{1}^{k_{1}} \cdots \psi_{n}^{k_{n}}
$$

After multiplying a common factor $\prod_{l \neq i}\left(2 k_{l}+1\right)$ on both sides of $(\#)$, we obtain

$$
\begin{aligned}
\left\langle\tilde{\sigma}_{n} \prod_{k \in S} \tilde{\sigma}_{k}\right\rangle_{g}= & \sum_{k \in S}(2 k+1)\left\langle\tilde{\sigma}_{n+k-1} \prod_{l \neq k} \tilde{\sigma}_{l}\right\rangle_{g}+\frac{1}{2} \sum_{a+b=n-2}\left\langle\tilde{\sigma}_{a} \tilde{\sigma}_{b} \prod_{l \in S} \tilde{\sigma}_{l}\right\rangle_{g-1} \\
& +\frac{1}{2} \sum_{S=X \cup Y, a+b=n-2, g_{1}+g_{2}=g}\left\langle\tilde{\sigma}_{a} \prod_{k \in X} \tilde{\sigma}_{k}\right\rangle_{g_{1}}\left\langle\tilde{\sigma}_{b} \prod_{l \in Y} \tilde{\sigma}_{l}\right\rangle_{g_{2}}
\end{aligned}
$$

which is the desired recursion relation $(*)$. The factor $2 k+1$ comes from missing $j$-th marked point in the Join-graph contribution, and the extra $1 / 2$-factor on Cutgraph contributions is due to graph counting conventions. Hence we derived Witten's Conjecture / Kontsevich Theorem through localization on the relative moduli space.
